

3 Ways to Reduce Water Usage

 beehiveplumbing.com/3-ways-reduce-water-usage/

With global droughts and unpredictable weather patterns, water conservation has become one of the biggest challenges today. **Conserving water is essential for ensuring a bright future**, and **countries around the world are striving to get their systems under control**. In America, many states have recently experienced harsh droughts which *forced communities to quickly change their water consumption habits*. However, once the droughts had passed, many people continued to follow conservation practices without a second thought!

Simple things like not letting the faucet run while you brush your teeth can save nearly **two gallons of water per minute**. Plus, it can **save you a tremendous amount on your next water bill!** Here are three ways you can **immediately reduce water usage** in your home or business today!

1- Low-Flow Toilets

On average, **more water is wasted in the bathroom than anywhere else in your home**. While you can take **shorter showers** or **turn off the faucet**, the **toilet** remains the biggest waste in the room. Luckily, you can **switch to a newer low-flow toilet that saves the water for you!**

Most models made before 1994 continue to use three to five gallons of water per flush. *To be certified as a low-flow toilet, newer models must use no more than 1.6 gallons for each flush*. This means that you can **save an average of 60%** or more without changing your habits at all!

At [Beehive Plumbing](#), our expert team in Utah can assess your current toilet and advise a new one that fits your needs. **For saving water and significantly cutting down on your bill, a low-flow toilet continues to be one of the wisest investments today.**

2- Urinals

Urinals are very helpful for businesses, and even homeowners, as **they take up minimal space, reduce water usage**, and ensure that customers can **avoid long wait times**. Unlike toilets, you can **retrofit your urinal with simple upgrades that will quickly and immensely reduce water usage**. **While an average urinal uses one to three gallons per flush, newer models and upgrades can reduce water usage by nearly 50-90% per flush.**

Another option includes switching to a **waterless urinal** which uses *gravity* instead of traditional flushing. With all of these options, you can **drastically cut down on water usage** while *maximizing space and efficiency*. Since the price of water isn't going down anytime soon, you're also looking at **significant savings over the following years!**

3- Tankless Water Heaters

Classic **water heaters** come with a number of problems including long wait times for hot water, wastage, and the possibility that the tank may burst when you least expect it. With **tankless water heaters**, **you can get hot water right when you want it at any moment**. Since it **doesn't waste time heating water when you don't need it**, *you'll never have to pay more for your hot baths again!* Best of all, there's **no risk of spillage since the water is pulled and heated in real time**.

Conserve Water by Contacting Beehive Plumbing in Utah Today

With an expert team of fully **licensed, bonded, and insured master plumbers**, you can count on **Beehive Plumbing** to get the job done!
